

555 Timer IC

July 30, 2026

This tiny project serves as an introduction to the workflow for upcoming projects. The plan is to develop a blueprint to construct easy to follow explanations and constructions. In broader context, all projects are designed to deepen and hone the theoretical knowledge imparted unto me through my studies as an electrical engineer. I might even publish this someday, so that future generations might learn complex topics, with a hands on approach to understanding. I will try to keep the necessary tools and gadgets to a minimum, although having a basic little setup is unfortunately mandatory. Since many universities and their faculties provide a space to help students get their first experience with such tools, I highly recommend using these opportunities.
